Improves
Lubrication

Reduces
Component Wear

Power
Steering
Flush

Cleans entire
system of
Contaminants

12 Volt DC
System

The power steering system is one of the most neglected areas in a vehicle. In order to function properly, regular maintenance is required.

In time the power steering fluid becomes contaminated and loses its ability to lubricate effectively. This results in metal to metal wear, which then contaminates the system with metallic debris. This in turn leads to leaks, pump noise, and mechanical failure.

The PSF 200 is designed to flush out the old contaminated fluid and replace it with new power steering fluid.

With the PSF 200 system, this service is made easy.
